diseases. The present sequence is a gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, andemia, cancer, acute myeloid leukaemia, Alzheimer's disease, AIDS, epilepsy, neurofibromatosis, treematoid arthritis, psoriasis and inflammatory/ulcerative bowel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acid comprising fragment of chemically modified for diagnosis and treatment of diseases associated with cytosine methylation .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arterioscierosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, ALDS, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     942

                                                                                                                                                       Sequences AAS45296-AAS45520 represent chemically pretreated genomic DNA molecules associated with the cell cycle and specific PCR primers of the invention. The sequences are useful for detecting the methylation state of all CpG dinucleotides in a sequence and therefore for analysing associated diseases. By analysing cytosine methylations in the pretreated DNA, genetic and/or epigenetic parameters for the diagnosis and therapy of existing diseases or the predisposition to specific diseases can be ascertained. The parameters may be compared to another set of genetic and/or epigenetic parameters, the differences serving as basis for diagnosis and/or prognosis events which are disadvantageous to patients. The sequences of the invention are useful for the diagnosis and therapy of HIV infection, neurodegenerative disorders, graft-versus-host disease,

CC Chemically pretreated DNA of genes associated with DNA transcription from CC one of 346 Sequences, and an oligomer, in particular an oligonucleotide or peptide nucleic acid (PNA)-oligomer that hybridises to or is identical transcription. The set of oligomer probes are useful for detecting the CC transcription. The set of oligomer probes are useful for detecting the CC in a chemically pretreated DNA of genes associated with DNA cytosine methylation state and/or single nucleotide polymorphisms (SNPs) in a chemically pretreated genomic DNA. The nucleic acids are useful for defection, retroviral infection, sezary syndrome, CC diagnosing or treating diseases associated with DNA transcription CC disconsing of the methylation status), e.g. adenosine deaminase CC haematological disorders, immunological disorders, werner syndrome, cc tuberculosis, developmental disorders, psoriasis, Rieger's syndrome, tuberculosis, developmental disorders, psoriasis, Rieger's syndrome, CC syndrome, Netwann-Pick disease, myelodysplastic syndrome, myocardial cf. disease, HDR syndrome, arthritis, polyglutamine disorders, solid tumours or cancer. Sequences ABX28127-ABX28147 represent DNA transcription consociated genomic DNA molecules of the invention.

CC specification but was obtained in electronic format directly from the curonean Patent office.

                                                                                                                                                                                                                DNA, genetic and/or epigenetic parameters for the diagnosis and therapy of existing diseases or the predisposition to specific diseases can be ascertained. The parameters may be compared to another set of genetic and/or epigenetic parameters, the differences serving as basis for diagnosis and/or prognosis events which are disadvantageous to patients. The sequences of the invention are useful for the diagnosis and therapy of HIV infection, neurodegenerative disorders, graft-versus-host disease, aging, glomerular disease, Lewy body disease, arthritis,

                                                                                                                                                                                                                                                                                                                                       Sequences AAS45296-AAS45520 represent chemically pretreated genomic DNA molecules associated with the cell cycle and specific PCR primers of the invention. The sequences are useful for detecting the methylation state of all CPG dinucleotides in a sequence and therefore for analysing associated diseases. By analysing cytosine methylations in the pretreated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Designing primers and probes for analysing diseases associated with cytosine methylation state e.g. arthritis, cancer, aging, arteriosclerosis comprising fragments of chemically modified genes

CC The invention relates to a nucleic acid comprising a sequence of 18 CC bases, of a segment of chemically pretreated DNA (CP DNA) e.g. with CC bisulphite, of genes associated with tumour suppression and CC oncogenes having a sequence taken from 536 (actually 533 since CC (SS) and sequences complementary to (cs). The nucleic acid may be a CC peptide nucleic acid-oligomer (PNA) of at least 9 nucleotides and may CC form part of a set of probes for detecting the cytosine methylation state and/or single nucleotide polymorphisms and also to be used in an CC array for analysing diseases associated with CpG dinucleotides e.g. CC ascertaining genetic and/or epigenetic parameters for the diagnosis cand/or therapy of existing diseases or the predisposition to specific CC and/or therapy of existing diseases or the predisposition to specific CC diseases, by analysing cytosine methylations. The parameters may be compared to another set of genetic and/or epigenetic parameters, the cc differences serving as basis for diagnosis and/or prognosis events which CC 33 genomic sequences derived from tumour suppressor genes and CC complementary sequence of the corresponding odd numbered sequence (e.g. CC D2 and IDI, ID 536 and ID 535, except for those whose partner sequence CC is missing).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

(EPIG-) EPIGENOMICS AG

Olek A, Piepenbrock C,

WPI; 2002-090046/12

New nucleic acids or oligomers, useful for diagnosing or treating diseases associated with DNA transcription, e.g. immunological disorders, Werner syndrome, psoriasis, myocardial infarction, solutionurs or cancer

Claim 1; SEQ ID No 100; 32pp; English

CC The invention relates to a nucleic acid, which comprises a segment of the CC chemically pretreated DNA of genes associated with DNA transcription from CC one of 346 sequences, and an oligomer, in particular an oligonucleotide CC to the Chemically pretreated DNA of genes associated with DNA transcription. The set of oligomer that hybridises to or is identical CC transcription. The set of oligomer probes are useful for detecting the CC in a chemically pretreated genomic DNA. The nucleic acids are useful for C in a chemically pretreated genomic DNA. The nucleic acids are useful for CC in a chemically pretreated genomic DNA. The nucleic acids are useful for CC in a chemically pretreated genomic DNA. The nucleic acids are useful for CC in a chemically pretreated genomic DNA. The nucleic acids are useful for CC diagnosing or treating diseases associated with DNA transcription CC disease, with the methylation status), e.g. adenosine deaminase CC deficiency, with the methylation status), e.g. adenosine deaminase CC deficiency, viral infection, retroviral infection, Sezary syndrome, CC deficiency, viral disorders, immunological disorders, werner syndrome, CC uncological disorders, neurodegenerative disorders, werner syndrome, CC syndrome, Niemann-Pick disease, myelodysplastic syndrome, myocardial CC disease, HDR syndrome, arthritis, polyglutamine disorders, solid tumours CC associated genomic DNA molecules of the invention.

Note: The sequence data for this patent did not form part of the printed CC European parent office. European Patent Office

                                                                                                                                                                                                                                                                                                                                     ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a gene (I) derived from Buchnera sp. CC containing the DNA (a) or (b), (a) has a fully defined base pair CC sequence selected from a table of sequences found in the Buchnera sp. CC genomic DNA of ABA92787 given in the specification or is a DNA selected from complementary DNA sequences, and (b) is a DNA which hybridises with the DNA (a) and encodes a protein. Also described are: (1) a recombinant vector (II) containing (I); (2) a transformant (III) containing (II); (3) a genomic DNA of Buchnera sp. containing the sequence given in ABA92788; (4) a plasmid derived from the sequence given in ABA92788; (d) a plasmid derived from the sequence given in ABA92788 and (d) is a plasmid which hybridises with a DNA; and (5) a method for the preparation of a protein in which (III) is cultured and the expression protein of the objective protein is collected from the resultant culture. The DNA is useful for developing agricultural chemicals for exterminating cockroaches. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             cc signal transduction associated genes. The DNA sequences are chemically cc disulphite. Also disclosed are oligonucleotides and/or PNA oligomers cc for detecting the cytosine methylation state (CpG islands) of these cc genes, and a method for the diagnosis and/or therapy of genetic parameters of genes associated with signal transduction. CC contain DNA, e.g. cell lines, blood, sputum, stool, urine, cc cerebral-spinal fluid, tissue embedded in paraffin such as tissue from cc yes, intestine, kidney, brain, heart, prostate, lung, breast or liver, cc sequences of the invention are useful for the diagnosis and therapy of cancer. ABK31158-ABK31545 represent chemically pretreated genomic DNA compensation, or their complementary segmences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                            577.
